

Jasco launches IaaS offering through NewTelco SA

International telcos and service providers looking to grow their client bases are starting to look to South Africa's telecoms market.

“Internationally, markets for telco services are maturing. In the US, Europe and Asia, Telcos and service providers with sophisticated products – think cloud, voice, data, security, IoT, analytics, content and infotainment – are facing increasing competition in a crowded market. They need new markets for proven products. Sub-Saharan Africa, a fast-growing emerging market with more [fibre to the home](#) and to businesses (FTTH and FTTB) being rolled out daily, offers opportunity. However, to enter this market they face a number of infrastructure, regulatory, and business challenges,” says Eckart Zollner, business development manager at Jasco.

Regulatory requirements

Regulatory requirements include a stipulation that they must offer their services from an in-country data centre if they want to operate locally. There is also privacy (PoPI Act) and other legislation that they must comply with. This means that to enter this market, they either need to build their own infrastructure or partner locally with a service provider able to deliver their services.

“NewTelco’s IaaS offering provides them with exactly what they need – the infrastructure, support and reliability they need to offer their services to customers with the assurance that they comply with key security and privacy legislation.”

The NewTelco SA IaaS offering for international carriers includes servers, storage, co-location, local and global interconnects with other ISPs and telcos, as well as backhaul, distribution and operations- and business support systems (customer onboarding, billing and administration).

Unpacking the future for technology, media and telecoms in Africa

12 Oct 2017

NewTelco SA’s IaaS offering is built on global market experience. “In addition to our large data centre in South Africa, NewTelco has a strong presence across Europe, serving international carriers. It has also recently begun offering services out of data centres in Kenya to facilitate the establishment of a carrier community in East Africa, as more services are rolled out to that region,” notes Zollner.

Zollner believes the entry of international players in the local market over the next three years will bring welcome competition as well as present significant opportunity for local players to partner with successful global service providers.

NewTelco South Africa’s local and European teams will be showcasing the IaaS offering at the third annual Africa 2017 GCCM – Cape Town on 5-6 November 2017; and [AfricaCom](#) on 7-9 November 2017.
